

CASE STUDY

Surface preparation and spraying Concrete plants—Somerset

During the summer we have undertaken two big projects on concrete plants across Somerset.

In both cases, we swept blasted the cladding on the concrete hoppers, removing any existing coatings and rust preparing it for a top coat.

Once complete, we then sprayed a one coat paint system (Selemix) to protect the surface. This was done using an airless spraying system.

We are experienced at this type of work, and more details can be found on our website at
